

HEATING CABLE 6 mm

10, 14, 18, 20 W/m

A robust universal and cost-effective cable which is suitable for providing comfort heating or primary heating of the room beneath any floor covering. The cable is robust and suitable for fastening on reinforcement grids and embedding in concrete, which makes it a perfect solution for new builds or renovation projects where a new screed will be laid.

When the heating cable is fully embedded, it warms the screed above and around it, building up heat in the floor which is slowly released into the room, providing a very stable temperature. Heating cables are a flexible solution that allows you to adjust the power output per m² according to your individual need. The power output varies according to the cable spacing, which is referred to as the centre-to-centre distance. The smaller the distance between heating cables the more power output and vice versa.

The cable is available in four ranges of power outputs and offers a wide range of application possibilities and installation options. More details on special purposes and application areas of each power output of the cable can be found in the product datasheets.

ADVANTAGES:

- Suitable for all types of flooring and different applications
- Perfect for any situation where a new screed or concrete is going to be laid
- Strong design, but flexible to install
- Highly reliable and resistant to high temperatures
- Installation does not require a perfectly flat floor surface
- Available in 4 power outputs, each in different lengths
- Made in Denmark
- Covered by a 25-year warranty
